"The Clinical Aspects and Therapy of Trichinosis"

Budapest, Orvosi Hetilap, Vol 107, No 31, 31 Jul 66, pages 1449-1452.

Abstract: [Authors' Hungarian summary modified] The clinical manifestations, diagnosis and therapy of trichinosis are summarized on the basis of literature data. The course of the disease is described in response to treatment with chlorocide and prednisolone (4 cases) as well as thiabendazole (1 case; 40 mg/kg body weight daily doses for 3 days, a total of 7200 mg). It is stressed that severe cases of trichinosis must be given effective causal therapy in order to prevent the eventual lethal outcome of a massive infestation. 12 Hungarian, 9 Western references.

"Evoked Potentials in the Strychninized Cerebral Cortex of the Cat"

Budapest, Acta Physiologica Academiae Scientiarum Hungaricae, Supplement, to Vol 22, 1963; pp 27-28.

Abstract [Authors' English summary, modified]: The potentials evoked by an auditory stimulus, as well as the spontaneous strychnine potentials have been studied on the gyrus ectosylvius of cats anesthetized with chloralose. One percent GABA applied superficially on the cortex greatly augmented the evoked potentials. It is thought that the neuronal substrate of the specific evoked potentials differs from that of the strychnine effect. Some problems of the neuronal organization of the cortex, as well as the mode of action of GABA and of strychnine have been discussed.

"The Relation between Electroencephalographic and Motor Responses During Evipan Anesthesia."

Budapest, Ideg. Szemle, Vol 17, No 10, Oct 1964, pages 305-310.

Abstract: [Authors' Hungarian summary modified] In man, the "slow synchronized" character of [illegible] responses to peripheral impulses is the more pronounced the deeper the anesthesia. Biological signs of developing narcosis are accompanied by more prolonged synchronization. An increased participation of more rapid frequencies in the EEG response is evidenced. Later, double responses arise (desynchronization and post-synchronization). The anesthesia takes place at the time of "pure desynchronization" responses. During the effect of the barbiturate, the pupillomotor reactivity is sluggish compared to the morphological sensitivity of the EEG. Under the effects of moderate amounts of barbiturate, the EEG is hyperreactive but is soon extinguished under deep anesthesia. 3 Hungarian, 32 Western references.

Serum bilirubin and bilirubinuria. Mihály Halász (Tudományegyetemi Belklinika, Pécs, Hung.). *Magyar Belorvosi Arch.* 1, 102–8(1948); cf. C.A. **43**, 3913c.—The total bilirubin and direct bilirubin contents of serum were detd. on 24 persons. Simultaneously the bilirubin in the urine was detd. The serum direct bilirubin was 2.05–32.02 mg. % against a total bilirubin content of 3.64–46.12 mg. %. The bilirubin of urine was 0.08–10.65 mg. %. The excretion of bilirubin in the urine seemed to be correlated with the content of direct bilirubin in serum. The tests were made by the method of Jendrassik-Cleghorn (*Biochem. Z.* 289, 438(1937); C.A. **31**, 2247⁹). 22 references.

"Psychological Analysis of Frigyes Karinthy's Literary Talent"

Budapest, Magyar Pszichologiai Szemle, Vol 19, No 3, 1962, pp. 338-348.

Abstract: The writings of the late KARINTHY, Frigyes, a Hungarian literarist, were reviewed. His talents were attributed to abilities of observation, logical and psychological analysis, self-observation, style-imitation, to associate by similarity, and to associate on the basis of acoustico-motoric verbal experience. Twenty-three references, including 12 Hungarian (Karinthy's works), 5 Russian, and 6 Western.
